Alterations of the urine cytology or urine sediment can lead to a diagnosis of urological diseases such as upper urinary tract tumors and renal disorders. To enhance the diagnosis and treatment of these diseases, urologists should be familiar with the various diagnoses of microscopic hematuria and how to conduct urine cytological or microscopic examination, as well as performing urological examinations. For example, renal biopsy is an important examination to determine a renal disorder, and a renal biopsy is needed to rule out a renal disorder after diagnosis of microscopic hematuria. Furthermore, a complete assessment of the patient, including a complete medical history, general examinations, and imaging and other studies to rule out an underlying disease, are required to provide appropriate and necessary therapy. Q: SharePoint Library Metadata not showing on document library I'm using SharePoint 2010 and using below metadata definition for document library. It doesn't show me any metadata. A: The SideNav Metadata Types (STS#M\_USERIK\_CATEGORYIK\_DOCUMENT) should be declared using the following schema (for document libraries only)

This invention relates to a method for controlling the amount of fuel to be injected into an internal combustion engine in order to control the amount of exhaust pollutants. More particularly, the invention is concerned with a method for controlling the exhaust pollution emitted from an internal combustion engine in which the ratio of fuel to air is feedback controlled as a function of the air flowing through the engine. Many prior art methods are already known for controlling the amount of air supplied to an internal combustion engine as a function of the amount of air required to burn off the exhaust emissions from the engine as a function of engine load. Such prior art methods have used various control techniques including positive and negative feedback control. The purpose of exhaust gas emission control is to maintain the amount of pollutants which are discharged into the atmosphere within the limits of the environmental protection laws and regulations. Thus, any variation of engine load can cause a

---

corresponding variation of pollutant discharge from the engine. In addition to exhaust emission control, the engine itself is operated to minimize fuel consumption. Here also the load on the engine varies with the amount of fuel required to meet the power demands of the engine. The need to simultaneously meet these conflicting requirements has resulted in prior art exhaust emission control methods for internal combustion engines which have been less than effective. High-speed ptychography using a convex lens array. Many gratings, lenses, and even simple mask projections can be combined to describe a system that solves an underdetermined set of coefficients for describing data. Such systems are referred to as under-determined linear systems. The Babinet principle states that such a system can be described in a Fourier domain as a convolution, and the regularized linear least squares solutions are thus a Fourier transform of the inverse data. Theory-driven methods for ptychographic data acquisition are developed to invert such under-determined linear systems. We present a unique property of ptychographic data acquisition: we can apply the optical lens array as a conjugate to the double Fourier transform used for data acquisition. This ptychographic reciprocity allows for data collection to be complete and linear then perfect imaging, especially when using a small camera. We use this principle to demonstrate high-speed ptychographic scanning capable of measuring a full image at  $f_0$ .
